

Your facility has partnered with TapestryHealth, an innovative company that helps long term care centers provide timely and high-quality care to residents. We work together to create a personalized plan of care to prevent hospitalizations and emergency room visits or to get residents to the hospital faster, when necessary.

TapestryHealth provides facilities with services such as Daily Risk Reports, Chronic Care Management Reports, and/or Remote Physiologic Monitoring. These services address the complex healthcare needs of patients with multiple chronic conditions by:

- Highlighting the residents who are most at risk of experiencing an acute event
- Identifying subtle changes in health status indicators that are early warnings for worsening conditions
- Providing recommended care plans for chronic diseases and acute events

In accordance with the Center for Medicare & Medicaid Services (CMS) guidelines, an initiating patient visit is required before TapestryHealth can begin providing services to each resident.

During an Initiating Patient Visit, a Tapestry Health clinician will talk with each resident to educate the resident and/or designee on Chronic Care Management and Remote Physiologic Monitoring. In addition, the clinician will inform the resident and/or designee that:

- Only one practitioner can provide a similar service at a time.
- This does not replace the relationship with a primary care provider or other specialists.
- These services can be stopped at any time
- Cost sharing is possible depending upon insurance coverage

If the resident is unable to communicate with our providers or is cognitively impaired, we will send an email and/or text to the resident's designated contact to explain our services and seek electronic consent via a HIPAA compliant link from CareAscend.

The TapestryHealth team will be in contact with your facility to schedule Initiating Patient Visits.
